ASIAN DEFOLIATORS: *Dendrolimus* spp.  
(Lepidoptera: Lasiocampidae)

**Siberian silk moth**  
Male wingspan: 40–60 mm; female: 60–80 mm  
Key features include two dark, notched stripes on the wings, which are rather indistinct due to various amounts of gray and brown scales. A white spot is usually present near the base of the forewing. Both males and females are similar but females are larger, with broader wings.

**Pine tree lappet moth**  
Male wingspan 50–70 mm; female: 70–90 mm  
Similar to *D. sibiricus* but has prominent brown bands located at the base of the forewing and spanning the wing at roughly ¾ of the way to the edge. Brown bands are especially prominent due to the lighter gray coloration between bands. A white spot is present on the forewings, as in *D. sibiricus*. All dark markings are subdued in form 2.

**Masson pine moth**  
Wingspan: 50–80 mm; females larger  
Wings mostly uniform brown, with line nearest outer edge of forewing unconnected, more dotted rather than mostly continuous as in *D. sibiricus* and *D. pini*.

This photo guide is part of a diagnostic set. Visit www.FirstDetector.org for more SHARPENING OBSERVATION SKILLS materials.
ASIAN DEFOLIATORS: *Dendrolimus* NATIVE look-alikes (Lepidoptera: Lasiocampidae)

native male look-alikes
